

EPA Releases the Fourteenth Edition of the Superfund Remedy Report

The Superfund program recently issued the Fourteenth Edition of its **Superfund Remedy Report**, the latest in a series providing information and analyses on remedies selected to address contamination at Superfund sites. The report compiles data on overall remedy selection and on remedies for source material (such as soil and sediments), groundwater and air related to vapor intrusion. This edition focuses on the analysis of Superfund remedial actions from Fiscal Years 2009-11, and includes remedies selected in 459 decision documents signed in this three-year period. The report also includes the analysis of remedy selection trends over a longer timeframe. New to this edition is a separate analysis of sediment and vapor intrusion remedies. This report also provides a one-time analysis of characteristics of sites under investigation, to gain insight into possible upcoming remedies. The final report is posted at <http://www.epa.gov/superfund/remedytech/srr/> and www.cluin.org/asr.
